Strong recommendations made in all three regions of the globe that a linear collider is a necessary instrument for study of particle physics at TeV energies.

All desire to host the collider, and to construct it as soon as possible.

A nation-wide U.S. Linear Collider Steering Committee is being established.

ICFA is forming an international linear collider steering committee.

Two horses left --- TESLA and NLC/JLC --- and the finish line drawn across the track:

Completion of the first high-gradient (800 GeV) cryo-module in 2003 with operation at TTF-II in 2004.
